_move_free_pages

pageblock_unisolate
_and_move_free_pages

__move_freepages_block
_isolate

```
graph LR; A["pageblock_isolate_and<br/>_move_free_pages"] --> C["__move_freepages_block<br/>_isolate"]; B["pageblock_unisolate<br/>_and_move_free_pages"] --> C;
```

The diagram illustrates a code refactoring or abstraction. On the left, two separate function names are listed in white boxes: 'pageblock_isolate_and_move_free_pages' and 'pageblock_unisolate_and_move_free_pages'. Blue arrows from both of these functions point to a single, shaded gray box on the right, which contains the name '__move_freepages_block_isolate'. This suggests that the logic of both original functions is being consolidated into a new, shared function.
